Summary

Full-stack Engineer with backend-heavy experience building production systems at a YC-backed startup - data pipelines, microservices, internal dashboards, and ACID-safe financial backends. Comfortable across Node.js, Python, FastAPI, React, and distributed systems design. Seeking backend/full-stack SDE or AI infrastructure roles.

Skills

Languages: JavaScript, Java, Python, Go, TypeScript

Backend & Systems: Node.js, FastAPI, REST, gRPC, JWT, Microservices, Docker

Frontend: ReactJS, Next.js

AI / ML: LLMs, RAG, LangChain, Vector Databases, Embeddings

Tools: Git/GitHub, AWS S3, CloudWatch, Postman, Vercel, Render, MongoDB, PostgreSQL

Experience

Streak (YC W22) (on-site, Bengaluru)

April 2026 – May 2026

SDE Intern

- Engineered backend **data pipelines** integrating Shopify webhooks into the purchase system, expanding tracked purchase volume from **800 to 9k+** monthly orders.
- Improved **data consistency** by identifying event-tracking gaps in **funnel flows** and fixing missing attribution.
- Optimized **data migration** via backfill scripts, processing **~5.4k records** with resolving performance bottlenecks.
- Built and enhanced internal React dashboards by implementing new features, integrating backend APIs, and resolving UI issues for cross-functional teams.

Freelance (Remote, US Clients)

Jun 2024 – Dec 2024

- Delivered multiple production-ready apps including Web3 dApps, dashboards, and backend API systems.
- Led a 5-member technical team delivering blockchain solutions and production deployments.

Projects

DevHire (Microservices Hiring Platform)

GitHub Oct 2025

- Built a **7-service microservices architecture** with services for Auth, Jobs, Assessments, Evaluation, Scoring, Notifications, and API Gateway.
- Reduced inter-service latency by **~35%** using **gRPC** between core services versus REST-only calls.
- Containerized all services with Docker & Docker Compose, enabling **<2 min setup** with isolated environments.
- Implemented **JWT authentication** with **RBAC** for Recruiter and Developer roles and exposed **15+ REST endpoints** via centralized API Gateway.

Resolve AI (RAG Agent)

GitHub Apr 2025

- Engineered an **LLM orchestration** backend using **LangChain + FastAPI**, combining **RAG retrieval** with agent tooling for automated support query resolution.
- Built an end-to-end **retrieval pipeline** (PDF ingestion, chunking, embedding, and **FAISS vector search**) to deliver context-grounded responses.
- Integrated an **ML confidence scoring** layer with threshold-based routing to return final answers, flag uncertain responses, and auto-escalate low-confidence cases.

Payment Ledger System (Wallet + Transfer Backend)

GitHub Jan 2026

- Built a production-style wallet backend with JWT authentication and clean separation of API, service, and database layers (FastAPI + PostgreSQL/Neon).
- Added ACID-safe money transfers using SQL transactions with **row-level locking** to prevent race conditions.
- Designed idempotent transfer APIs, ensuring safe retries and preventing duplicate payments.
- Improved transaction history performance using DB indexing and **cursor-based pagination** for scalable reads.

Open Source Contributions

- Fixed Windows tests, offline provider discovery, and replay initialization in **Experiential Labs (YC S26)**.
- Improved LM Studio model selection, Windows spellcheck, and theme rendering in **OpenWork (YC P26)**.

Education

ABES Engineering College

Nov 2022 – May 2026

- B.Tech in Computer Science **GPA: 8/10**
